(PDF) Digital signal processing: Adaptive signal processing

Adaptive Signal Processing is concerned with the design, analysis, and implementation of systems whose structure changes in response to the incoming data. Application areas are similar to those of optimal signal processing but now the environment is changing, the signals are nonstationary and/or the parameters to be estimated are time-varying.

Bernard Widrow's Profile | Stanford Profiles

Least mean squares algorithms are a class of adaptive filter used to mimic a desired filter by finding the filter coefficients that relate to producing the least mean square of the error signal. It is a stochastic gradient descent method in that the filter is only adapted based on the error at the current time. It was invented in 1960 by Stanford University professor Bernard Widrow and his first Ph.D. student, Ted Hoff.
