The purpose of this report, Guide for Design of Steel Transmission Towers, is to provide a basis for the structural design of self-supporting steel transmission towers throughout the United States. This report has been developed to provide more specific loading recommendations for transmission towers, and it covers a wide range of information.

Steel Design Guide Series Two. Web openings have been used for many years in structural steel beams. This design guide summarizes design concepts for the practicing engineer and reviews the research and history of web openings. This guide also presents a unified design approach to both steel and composite beams with web openings, including the requirements for reinforcement. (60 pp.)

Guidance for the design of cast-in steel plates for connecting structural steel beams to concrete core walls is available in SCI-P416. This publication provides a model for the design of simple connections that transfer shear force due to permanent and variable loads and a non-coincident axial tie force resulting from an accidental load case.

Structural Shapes - standard steel configurations produced by steel mills such as wide flanges, channels, angles, pipe, tubes, etc. Structural Steel - the structural elements that make up the frame that are essential to supporting the design loads, e.g. beams, columns, braces, plate, trusses, and fasteners. It does not include for example cables.

An online design facility is available at www.steel-stainless.org/software for designing cold-formed stainless steel members subject to axial tension, bending or axial compression. The design facility calculates section properties and member resistances in accordance with the Recommendations in this Design Manual.

The first edition of this manual was issued in 1964 with the title Steel Pipe—Design and Installation. The second edition of this manual was approved in June 1984 and published in 1985 with the title Steel Pipe—A Guide for Design and Installation. The third edition of the manual was approved in June 1988 and published in 1989.

This classic manual on structural steelwork design was first published in 1955, since when it has sold many tens of thousands of copies worldwide. For the seventh edition of the Steel Designers Manual all chapters have been comprehensively reviewed, revised to ensure they reflect current approaches and best practice, and brought in to compliance with EN 1993: Design of Steel Structures (the so-called Eurocode 3).

This design Manual has been prepared for the guidance of engineers experienced in the design of carbon steel structural steelwork though not necessarily in stainless steel structures. It is not in any way intended to have a legal status or absolve the engineer of responsibility to ensure that a safe and functional structure results.

This guide presents a unified approach to the design of structural steel members with web openings. The approach is based on strength criteria rather than allowable stresses, because at working loads, locally high stresses around web openings have little connection with a member's deflection or strength.

Alongside edge geometry and design, blade steel is a critical element that determines how a knife performs. Steel is essentially an alloy (i.e. a mix) of carbon and iron that is often enriched with other elements to improve certain characteristics depending on the desired application.
