In an auto-combustion system, the incinerator is preheated using dry wood and/or other agricultural residues (e.g., coconut shells, charcoal, etc.). At some point, the waste itself generates the heat for continued combustion during the waste disposal process.

Incinerators can be subdivided into grate firing systems, fluidized bed systems (stationary and circulating FB's) and fixed bed systems. In MSW incineration, grate firing are the common systems with a wide distribution and a long-term experience. Typical grate firing systems for refuse incineration are shown in Figure 1: (i). Reciprocating grates,
