Radiation produces free electrons in the crystal, which fall into “traps” at the sites of lattice imperfections. Later, the crystal is exposed to a burst of laser light, which liberates the “trapped” electrons. This process releases light, in proportion to the original radiation dose.

The whole book is commendable and would sit as possibly 'the' contemporary classic on radiological physics. If this had extensive 'practice problems' (a la Hasegawas text some may know of) then it would surely be also 'the' book to assign for a decent course on radiological physics/radiation measurement.
