This carbon cycle model here is attached to a little climate model, that you can see the edge of it over here, that's the same one that we worked with in Module 3. And so, the carbon cycle model will control the atmospheric CO₂ concentration here, and then that will feed into the climate model here and control the greenhouse effect. And

Levels of carbon dioxide in the atmosphere have corresponded closely with temperature over the past 800,000 years. Although the temperature changes were touched off by variations in Earth's orbit, the increased global temperatures released CO₂ into the atmosphere, which in turn warmed the Earth. Antarctic ice-core data
