Network Theorems Problems With Solutions

Network Theorems (Part I)-Numerical Problems. Key points: - The problems considered in this set are involving both dependent and independent sources. Following points may be noted
Dependent sources are voltage or current sources whose output is function of another parameter in the circuit. Dependent sources only produce a voltage or current when an independent voltage or current source is in the circuit. Dependent sources are treated like independent sources when using nodal or mesh ...

The current through, or voltage across, any element of a network is equal to the algebraic sum of the currents or voltages produced independently by each source. In other words, this theorem allows us to find a solution for a current or voltage using only one source at a time.

Thevenin's and Norton's Theorems

Thevenin's theorem states that any two terminal linear network or circuit can be represented with an equivalent network or circuit, which consists of a voltage source in series with a resistor. It is known as Thevenin's equivalent circuit. A linear circuit may contain independent sources, dependent sources, and resistors.
