sagittal deformities. In most cases, many techniques are used for the final attainment of a stabilized, balanced spine.

Spinal Deformity and Correction: The Fundamentals ...

Gradual correction and lengthening uses the principle of 'distraction osteogenesis'. Bone and soft tissue are gradually distracted at a rate of 1 mm per day in four divided increments. Bone growth in the distraction gap is called regenerate. The interval between osteotomy and lengthening is called the latency phase and is usually 7-10 days.

Ilizarov principles of deformity correction

The correction of deformity is a fundamental part of orthopaedic surgery, which after all, means straightening children. The introduction of the concepts of Ilizarov has had a profound effect on understanding and management of deformity.
