The object of nearly all blasting operations is to break the rock sufficiently so that it can be removed. While it is physically possible to break rock using equipment such as rock saws and jackhammers, such methods are impractical, time-consuming, and expensive when dealing with significant amounts of rock.

Drilling and blasting is the controlled use of explosives and other methods such as gas-pressure blasting pyrotechnics, to break rock for excavation. It is practiced most often in mining, quarrying and civil engineering such as dam, tunnel or road construction. The result of rock blasting is often known as a rock cut. Drilling and blasting currently utilizes many different varieties of explosives with different compositions and performance properties. Higher velocity explosives are used for rela

Before addressing the field of explosives engineering, an area of major importance must be examined. This subject is the preparation of the shot area, better known as "drilling the holes in the rock." Any explo- sive engineer, blaster, shot-firer, or hole-loader will tell you that the shot can be only as good as the drilling allows.

Ground vibration induced by rock blasting is one of the most crucial problems in surface mines and tunneling projects. Hence, accurate prediction of ground vibration is an important prerequisite in the minimization of its environmental impacts. This study proposes hybrid intelligent models to predict ground vibration using adaptive neuro-fuzzy inference system (ANFIS) optimized by particle ...
