Morisky Medication Adherence Scale-8 | RehabMeasures Database

The Morisky Medication Adherence Scale, which started out as a four-item questionnaire, has since been expanded into a structured eight-question survey. While the four-item version (MMAS-4) includes elements of forgetfulness and symptom severity, the eight-question version (MMAS-8) delves into other situational and emotional aspects of medication adherence.

The Morisky Medication Adherence Scale: An Overview

Background: Adherence with oral hypoglycaemic agent is important to achieve optimal glycaemic control. The eight-item Morisky Medication Adherence Scale (MMAS-8) is frequently used for measuring drug adherence, yet the association between MMAS-8 score and glycaemic control among diabetes patients has not been addressed.

Abstract 558: The eight-item Morisky Medication Adherence ...

Among structured, self-reported scales, a four-item self-reported questionnaire to assess medication adherence was developed by Morisky et al. . Although the four-item scale has shown poor psychometric properties, it is one of the most widely used self-reported measures of medications adherence . Recently, an eight-item self-reported scale has been developed by Morisky et al. and called the Morisky Medication Adherence Scale (MMAS) . Because of the wide use of the scale as a medication ...
