In this post we introduce the gm/ID (transconductance efficiency) methodology used in analog circuit design to determine MOS W/L (width over channel length) ratios for designing differential amplifiers, operational transconductance amplifiers, etc.

Using the gm/ID methodology in analog circuit design ...

Written for beginners as well as professionals, this book provides a methodology for fixing currents and transistor widths of CMOS analog circuits to meet specifications such as gain-bandwidth while optimizing attributes such as low power and small area. Special attention is given to low-voltage circuits.

This paper presents an approach using gm/ID methodology for the design of the regulated cascode circuit (RGC) transimpedance amplifier (TIA) for optical receivers. The framework uses lookup tables produced using the gm/ID methodology to define the sizing of the transistors needed to reach the required specifications.

Now the professor also launches his gm/Id starter kit. The kit provides scripts that can co-simulate between SPICE simulator and Matlab and store transistor DC parameters into Matlab files. The data stored can then be used for systematic circuit design in Matlab. It looks brute-force but yet smart and efficient!
