Inhaltsverzeichnis Vorwort. Thermal analysis has proven to be one of the most important and meaningful test methods in the plastics industry and in testing laboratories. Although thermal analysis is used for fundamental studies related to materials science of polymers, its power lies in understanding this behavior during manufacturing processes.

Thermogravimetric analyzer. Thermogravimetric analysis (TGA) is conducted on an instrument referred to as a thermogravimetric analyzer. A thermogravimetric analyzer continuously measures mass while the temperature of a sample is changed over time. Mass, temperature, and time are considered base measurements in thermogravimetric analysis while many additional measures may be derived from these three base measurements.

Thermal analytical techniques are also used to study the effects of lyophilization and to develop optimal lyophilization formulations and cycles. Several techniques are also used to study kinetics in the solid-state, including decomposition, accelerated stability and the effects of aging on various formulations.
