Volterra Integral Equations And Fractional
 In mathematics, the Volterra integral equations are a special type of integral equations. They are divided into two groups referred to as the first and the second kind. A linear Volterra equation of the first kind is. $f(t) = \int_a^t K(t,s) x(s) ds.$ {\displaystyle f(t)=\int _{a}^{t}K(t,s)\,x(s)\,ds}

 Volterra integral equations of the form $y(t) = \phi + \int_0^t \rho(t,s)f(s,y(s))ds; \phi = y_0, z_0.$ We give a Theorem that guarantees that the solutions never intersect if $y_0 \neq z_0$ and we discuss several consequences of the order of the underlying multistep method, also in the generic case of solutions which are not smooth at the origin

 Abstract. Fractional powers of linear multistep methods are suggested for the numerical solution of weakly singular Volterra integral equations. The proposed methods are convergent of the order of the underlying multistep method, also in the generic case of solutions which are not smooth at the origin.

 Abstract. We discuss the numerical solution to a class of weakly singular Volterra integral equations in this paper. Firstly, the fractional Lagrange interpolation is applied to deal with the singularity of the solution, and efficient fractional collocation boundary value methods are developed. Secondly, local convergence estimates are derived from examining the asymptotic property of the solution and the interpolation remainder.

 Theory of linear Volterra integral equations A linear Volterra integral equation (VIE) of the second kind is a functional equation of the form $u(t) = g(t) + \int_0^t K(t,s)u(s)ds, t \in I := [0, T].$ Here, $g(t)$ and $K(t,s)$ are given functions, and $u(t)$ is an unknown function. The function $K(t,s)$ is called the kernel of the VIE. A linear VIE of the ...
